Harvest patient results, not patient tissue. Use Cook’s Biodesign® graft.

Dependable remodeling
The Biodesign material aids in the natural healing process and is as effective as autologous tissue with 96.3% of cases having stable tympanic membrane closures, after fully remodeling into well-vascularized patient tissue.¹

Easy to handle
Biodesign material is easy to manipulate, therefore allowing for improved surgical precision during positioning.¹

Time saving
Biodesign reduces the time and patient discomfort associated with harvesting of fascia and significantly decreases intraoperative time.¹
The Cook Biodesign Otologic Repair Graft is a multi-layer biomaterial derived from porcine SIS that aids in the natural healing process in various otologic procedures, including but not limited to myringoplasty and tympanoplasty. Biodesign material has been used for nearly 20 years and it is available in multiple sizes to meet your specific procedural needs.

**Tips to help you get the best possible results:**
- Debride the repair site to encourage tissue ingrowth.
- Maximize intimate tissue contact.
- Avoid excessive tension on the graft.
- Underlay technique has been proven to be successful.
