Manage postpartum hemorrhage.

Bakri®
POSTPARTUM BALLOON WITH RAPID INSTILLATION COMPONENTS
A simple solution for postpartum hemorrhage

Sequential procedure considerations for conservative management of uterotonic-resistant PPH

Vaginal birth (typical order)

1. Bimanual compression
2. Repair of any lacerations
3. Dilation and curettage to rule out retained placenta
4. Placement of intrauterine balloon
5. Selective embolization

Cesarean birth (typical order)

1. Bimanual compression
2. Inspection of the broad ligament and posterior uterus and for the presence of retained placenta
3. B-Lynch suture
4. Placement of intrauterine balloon
5. Uterine artery ligation

Note: The above flowchart describes sequential treatment considerations for uterotonic-resistant PPH with blood loss under 1,500 mL, after evaluation for uterine inversion and amniotic fluid embolism.

References
The Bakri Postpartum Balloon with Rapid Instillation Components is used to treat postpartum hemorrhage (PPH) after a cesarean section or vaginal delivery when conservative management of uterine bleeding is warranted.

When inflated with sterile liquid, the Bakri Postpartum Balloon with Rapid Instillation Components applies pressure to the uterine walls that may provide management of postpartum hemorrhage.

- Can be used following vaginal or cesarean delivery
- Includes rapid instillation components to facilitate timely inflation of the balloon
- May be used with B-Lynch compression sutures if clinically warranted
- Is constructed of latex-free silicone
