A nonpharmaceutical option for preinduction dilation.

Cervical Ripening Balloon
WITH STYLET
The Cook Cervical Ripening Balloon is a silicone double-balloon catheter with an adjustable-length malleable stylet. It is a nonpharmaceutical option for dilating the cervical canal prior to labor induction at term when the cervix is unfavorable for induction.

Technique for cervical dilation

1. Loosen the fitting on the proximal hub of the stylet and adjust the wire so that the distal tip of the stylet is even with the distal tip of the Cervical Ripening Balloon.
2. Tighten the fitting so that the wire does not move during manipulation, and seat the adjustable handle firmly into the blue port labeled “S.”
3. Use the stylet with the Cervical Ripening Balloon to traverse the cervix. Note: Once the cervix has been traversed and the uterine balloon is above the level of the internal uterine opening (internal os), remove the stylet before further advancing the catheter.
4. Advance the Cervical Ripening Balloon through the cervix until both balloons have entered the cervical canal.
5. Inflate the uterine balloon with 40 mL of saline. Once the uterine balloon is inflated, pull the device back until the balloon abuts the internal cervical os.
6. The vaginal balloon is now visible outside the external cervical os and should be inflated with 20 mL of saline.
7. Once the balloons are situated on each side of the cervix and the device has been fixed in place, add more fluid to each balloon in turn, until each balloon contains a maximum of 80 mL of fluid. Time the balloon placement so that the balloon is in place no longer than 12 hours before active labor is induced.

Refer to the Instructions for Use for complete information on product usage and a complete list of precautions, warnings, and contraindications.

The Cervical Ripening Balloon with Stylet

- Is an option for nonpharmaceutical dilation.
- Is associated with reduced rates of tachysystole and increased rates of vaginal delivery within 24 hours in comparison to prostaglandin E$_2$\textsuperscript{1}
- Ceases its mechanical action when the device is removed.
- Does not require traction.
- Creates steady pressure on the internal and external os throughout the dilation process.
- Has been shown to improve Bishop scores in nulliparous women in comparison to 30 mL Foley balloon catheters.\textsuperscript{2}
- Has a stylet that is completely contained within the catheter.

The Cervical Ripening Balloon is a silicone double-balloon catheter with an adjustable-length malleable stylet. It is a nonpharmaceutical option for dilating the cervical canal prior to labor induction at term when the cervix is unfavorable for induction.
The Cook Cervical Ripening Balloon is a silicone double-balloon catheter with an adjustable-length malleable stylet. It is intended for mechanical dilation of the cervical canal prior to labor induction at term when the cervix is unfavorable for induction.
